Topoisomerase IV Cleavage Kit
(isolated from *Escherichia coli*)

Product Description (Product Numbers #TCK001 and TCK002)

Topoisomerase IV is prepared by overexpressing the par C and par E subunits in *E. coli* and purifying them by methods adapted from Peng and Marians, 1999. It is supplied as a heterotetramer complex. The enzyme is supplied at a concentration of 10 U/µl in Dilution Buffer. (6.0 µM) 50 % cleavage can be obtained with 0.1µl (20 nM final concentration) in the presence of 50 µM Norfloxacin in a 30 µl reaction (see typical titration below).

Store at -80°C. (Stable for 12 months undiluted) For in-vitro laboratory research use only.

Dilution Buffer

40 mM HEPES-KOH (pH 7.6)
100 mM Potassium Glutamate
1 mM dithiothreitol
1 mM EDTA
40% (v/v) glycerol

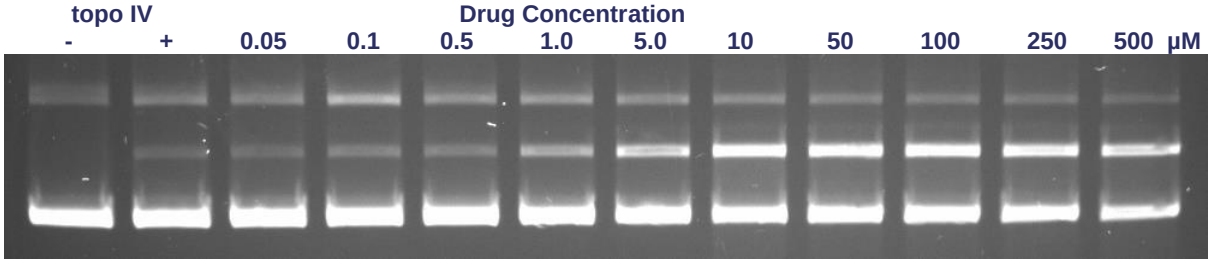
Assay Buffer
(supplied as 5X stock)

40 mM HEPES-KOH (pH 7.6)
100 mM Potassium Glutamate
10 mM Magnesium Acetate
10 mM dithiothreitol
50 ug/ml albumin

Cleavage Assay

1U *E. coli* Topo IV is incubated with 0.5 µg of supercoiled pBR322, in the presence of norfloxacin, in a reaction volume of 30 µl at 37°C for 1 hour in Assay Buffer.
0.2% SDS and 0.1mg/ml Proteinase K are added before a further incubation at 37°C for 30 minutes.
Cleavage is detected by the presence of a linear band.

Titration of Norfloxacin under cleavage conditions with *E.coli* Topo IV



Quality Control

Purity: The parC and parE subunits are purified to >95% purity as judged by SDS-polyacrylamide gel electrophoresis.

No activity was detectable when the single subunits were assayed alone

pBR322 was also incubated for 4 hrs in assay buffer + 10 mM $MgCl_2$ at 37 °C. These tests were negative for the formation of linear products, indicating the absence of nuclease contamination.
